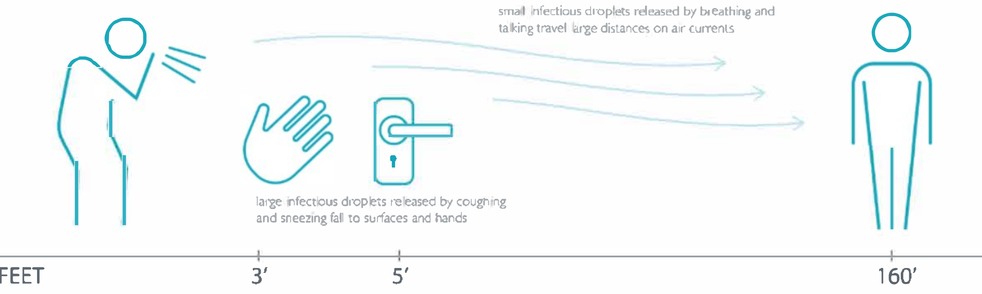
The science of clean air

# The Flu Season and the Coronavirus "Twindemic": How to Prepare and Prevent

Flu season has begun, and this year, the continuing coronavirus pandemic is only complicating the picture. COVID-19 and the flu are both contagious respiratory illnesses spread through aerosol transmission. In general, infected people spread viral particles by airborne droplets or aerosols whenever they talk, breathe, cough, or sneeze.

The infection propensities are most intense in confined spaces by the transmission of droplets and aerosols under varying ventilation conditions. As infectious disease experts across the nation work to prevent the spread of COVID-19, they're taking the fight to the air.



Aerisa's 200 Series ionization systems are highly effective atneutralizing MS2 Bacteriophage, a surrogate to both of these airborne pathogens. A recent 3rd party exhaustive report has just been published showing Aerisa Ionization is 99.9% effective at neutralizing MS2 Bacteriophage (COVID 19 surrogate).[i] The MS2 Bacteriophage is also used as a surrogate for H1N1.

Aerisa's ionization technology is also proven to be highly effective at removing other airborne viruses, bacteria, molds, and other pathogens. Aerisa manufactures products that purify the air in occupied spaces – where it's needed most – resulting in healthy, energy-efficient indoor environments in commercial, institutional, industrial, and residential buildings.

[i] Testing done on the following Products: Aerisa 2000 Series.

**ABOUT AERISA**

Aerisa manufactures bipolar ionization technology that results in **dramatic air quality improvements** in a wide array of markets including industrial, institutional, commercial and residential. Aerisa successes are found in the most demanding applications, such as wastewater treatment, food processing, casino, athletic, and transportation.
